

What has been working?

This program can run normally, the functions include:

- Generates a matrix with a specified probability and quantity.
- Save the generated matrix to a txt file.
- Reference different image materials and add them to the specified scratch-off image.
- With the function of reading coordinates and adjusting the position of picture material.

What has not been working?

The use of the current program requires a certain programming basis, and ordinary users cannot directly edit or modify to use all the functions of the program.

What can you do differently to address what hasn't been working?

In order to make the program friendly to all users, we plan to develop an easy-to-use interface.

This interface will allow users with no programming background to easily use all the features of the program for true threshold free operation.
